

USE-CASE FLOW SPEC

Use Case ID: UC-02

Use Case Name: Place Book Hold

Primary Actor: Student Member

PRECONDITIONS

The Student Member is already registered with the library.
The Student Member is logged in and verified in the system.
The requested title shows up in the ISBN catalogue.
The library system is up and running.

POSTCONDITIONS

The hold request gets recorded with no errors.
If the book is out on loan, the Student Member is placed into the FIFO hold queue.
The system shows the Student Member where they land in that line.
Reservation details are saved in the system.

MAIN SUCCESS SCENARIO

1. The Student Member looks up a book using an ISBN or catalogue details.
2. The system queries the ISBN repository.
3. Matching book info appears, along with whether it's available.
4. The Student Member picks the book they want.
5. They hit "Place Book Hold." Simple as that.
6. The system checks whether the Student Member is allowed to place another hold.
7. Then it checks the book's current availability.
8. The book's already loaned out, so the system drops the Student Member into the FIFO queue.
9. The system figures out the Student Member's queue position and assigns it.
10. A confirmation screen pops up with the book details and that position number.
11. The system saves the hold request. . Done. The flow ends successfully.

ALTERNATE FLOW - MEMBER NOT ELIGIBLE

6a. Member has hit the maximum allowed limit.

- 6a1. The system detects the Student Member has already reached the permitted cap for books/holds.
6a2. The new hold request gets denied.
6a3. The system shows a message saying the limit has been reached.
6a4. No queue entry is created for the Student Member.
6a5. The flow ends, and no reservation is made.
